PROFILE

First-year Automotive Engineering student at HAN University. My first year covered mechanical design, vehicle dynamics, and industrial automation — including real work with SolidWorks, CODESYS, and MATLAB. Looking for an internship or junior role where I can put this into practice.

UNIVERSITY

Bachelor of Engineering — Automotive Engineering 2025 – Present
HAN University of Applied Sciences, Arnhem, Netherlands

PROJECTS

Windmill Design & Manufacturing 2025
Mechanical Design — HAN University

- Designed and optimised windmill blade geometry in SolidWorks, applying aerodynamic principles to maximise rotational efficiency
- Physically manufactured the components using a lathe and milling machine, then assembled the full structure
- Performed stress and fatigue calculations to select an appropriate shaft material, achieving a safety factor compliant with design requirements

Vehicle Energy & Resistance Analysis 2025
Vehicle Dynamics — HAN University

- Conducted real-world tests on a car to measure the forces that slow it down (air drag, rolling resistance, hill incline)
- Compared live test data against engineering formulas — Experimental results aligned closely with theoretical models, with deviations attributed to tyre temperature variance and road surface conditions
- Presented the findings in a structured technical report

Go-Kart Powertrain Business Advisory 2025
Powertrain & Business Analysis — HAN University

- Acted as a technical consultant: advised a go-kart business owner on whether to switch to electric, hybrid, or keep petrol engines
- Factored in cost, infrastructure needs, performance, and long-term business impact — not just the engineering side
- Produced a structured technical and commercial recommendation, balancing engineering feasibility with capital expenditure and operational constraint

PLC Industrial Automation (3 Projects) 2025
CODESYS — HAN University Lab

- Developed and validated PLC safety logic for three industrial systems — a cutting machine, pump station, and conveyor belt — using CODESYS structured text and ladder diagram programming
- Tested everything on real PLC hardware — not just simulations
- Built HMI screens (operator dashboards) so non-technical staff could monitor and control the machines

SKILLS

Software: SolidWorks (CAD), MATLAB / Simulink, CODESYS (PLC programming)
Engineering: Mechanical design, powertrain analysis, vehicle dynamics, stress calculations
Manufacturing: Lathe, milling machine, basic welding — hands-on workshop experience
Other: Technical report writing, data analysis, business-oriented problem solving

CERTIFICATIONS

VOL-VCA — Certified to work safely in industrial and construction environments (Dutch health & safety standard)

LANGUAGES

English (Fluent) **Hindi** (Native) **Tamil** (Basic) **Dutch** (Learning)

INTERESTS & HOBBIES

Motorsport Engineering — following car engineering at the highest level. Jet engines/aerodynamics. Visiting car shows and engineering expos. Keeping up with EV and hybrid technology trends.
